Chancellor

## Teaching with *Impact Mathematics*

As you move through this document and the Impact materials, you will note many recurring themes and underlying programmatic structures that will support your classroom teaching:

- A. The Grades 6 through 8 program is a comprehensive curriculum that completes a full year of algebra by the end of Grade 8.
- B. Impact Mathematics is a standards-based, integrated curriculum that includes strands on number and operations, proportional reasoning, geometry, probability and data, with a focus on the development of algebraic thinking.
- C. There is a balance of basic skills and conceptual understanding; students build new mathematical ideas and at the same time practice needed procedures.
- D. The curriculum is centered around problem sets that students work on individually or in groups. Many of the problems are open-ended, allowing students to choose or develop solution strategies.
- E. Students are asked to make conjectures based on patterns they observe and to develop convincing mathematical arguments.
- F. Impact Mathematics provides opportunities for students to reflect upon, critique and communicate their ideas.
- G. The concepts in each chapter connect to and build on concepts developed in earlier chapters and courses.
- H. There is an emphasis on a variety of mathematical representations, as well as modeling.
- I. Informal to formal development of concepts makes mathematics accessible and appropriate for middle grades students.
- J. There is strong content progress from grade to grade with minimal reteaching of topics. Important topics are revisited in greater depth and formality.
- K. The contexts used for developing concepts and practicing skills include real-world applications, as well as mathematical settings.
- L. To maintain students' ongoing interest in all areas of mathematics, Impact Mathematics uses narrative and realistic contexts, personalization in the form of cartoons in which middle grades students explain how they approach problems, and opportunities for students to choose or create their own problems.
- M. Manipulatives and calculators are used to support the content learning only when appropriate. Students need and gain experiences with pencil and paper along with graphing technology.
- N. The teaching process is designed around a three-step instructional cycle: Introduce, Develop, and Assign & Assess.
- O. The curriculum balances structured learning, direct instruction, and creative problem-solving. Student discovery plays as significant a role in the learning process as teacher-directed instruction.
- P. Assessment tools are broad, encompassing the processes of problem solving, reasoning, communication, connections, concepts, applications, representational strategies and procedures.
